

California Cooperative Oceanic Fisheries Investigations (CalCOFI):

Innovative Data Products and Tools for California's Ocean Resource Management

The California Cooperative Fisheries Investigations (CalCOFI) has collected critical marine resource data off the coast of California since 1949. First formed to study the sardine population collapse, the program continues today, informing management of fisheries and the living marine environment, especially in the face of changing ocean conditions due to climate change.

Please join Dr. Brice Semmens, Director of CalCOFI, at UC San Diego's Scripps Institution of Oceanography, for a discussion of the history and future potential of this advanced coastal ecological monitoring program. Dr. Semmens will highlight the variety of data products and tools CalCOFI provides for California's fisheries and beyond.
